

Socioeconomic and environmental dynamics of land-cover and land-use change in the Cerrado frontier

Dr. Gillian L. Galford

Gund Institute for Environment,

Rubenstein School of Environment & Natural Resources

University of Vermont

02 April 2024, NASA LCLUC Science Team Meeting

Institutions and collaborations

Socioeconomic and environmental dynamics of land-cover and land-use change in the Cerrado frontier

- Obj. 1. Develop LCLUC detection methods and data sets
- Obj. 2. Characterize major land use transitions
- Obj. 3. Understand drivers of land use transitions

Cerrado physiognomies

Cerrado

- 2 million km²
- 43% of plant species are endemic
- Most unprotected savanna in the world

THREATS: expansion of croplands, deforestation

Brazilian agriculture

The miracle of the cerrado

Brazil has revolutionised its own farms. Can it do the same for others?

Aug 26th 2010 | CREMAQ, PIAUI | From the print edition

Like 1.9k Tweet 313

IN A remote corner of Bahia state, in north-eastern Brazil, a vast new farm is springing out of the scrub. This is one of the most productive and innovative farms in the world.

Welcome To Mato Grosso, The Giant Swath Of Land That's Feeding The Entire World

Soylandia (pg. 2)

By Susanna B. Hecht and Charles C. Mann

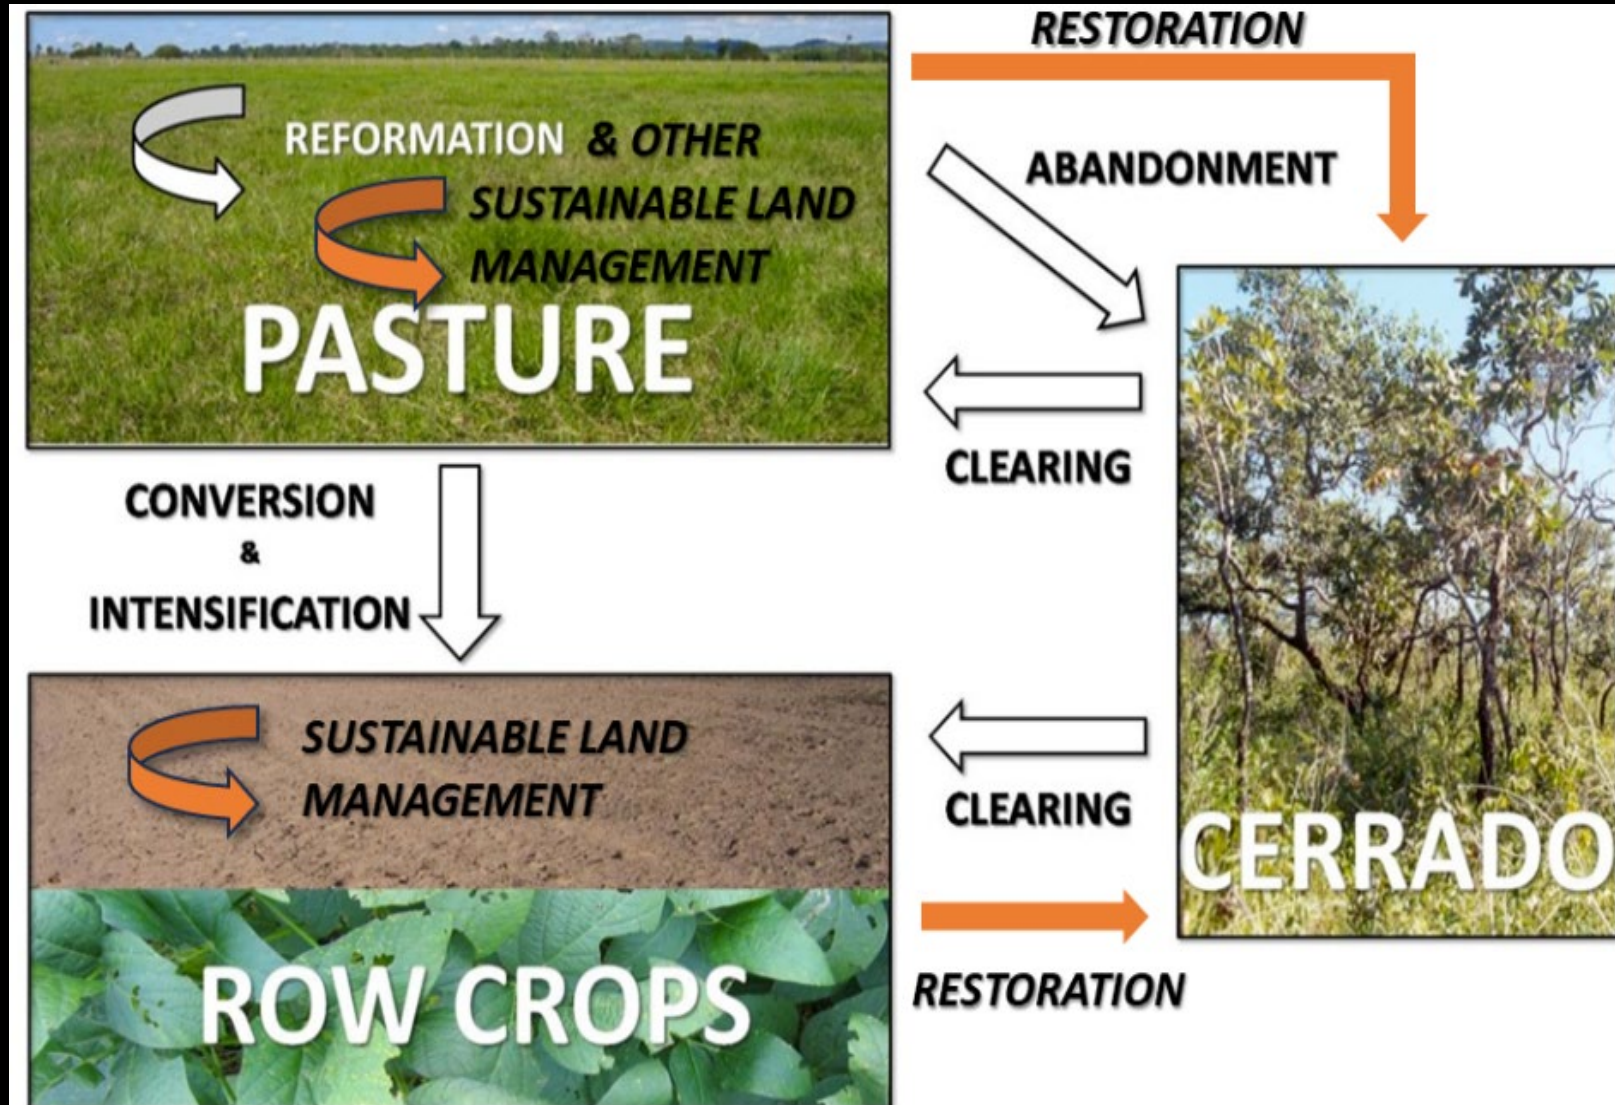

"It was a much bigger assault on an ecosystem than

LCLUC Hot Spot

- Historically, Cerrado deforestation increases when Amazon deforestation decreases (happening again now)
- Highest observed rates= $\sim 8,000\text{km}^2/\text{yr}$ (2011, 2012)
- Agricultural development is likely the largest driver but poorly constrained in terms of underlying environmental and socioeconomic factors
- Indirect drivers also at play

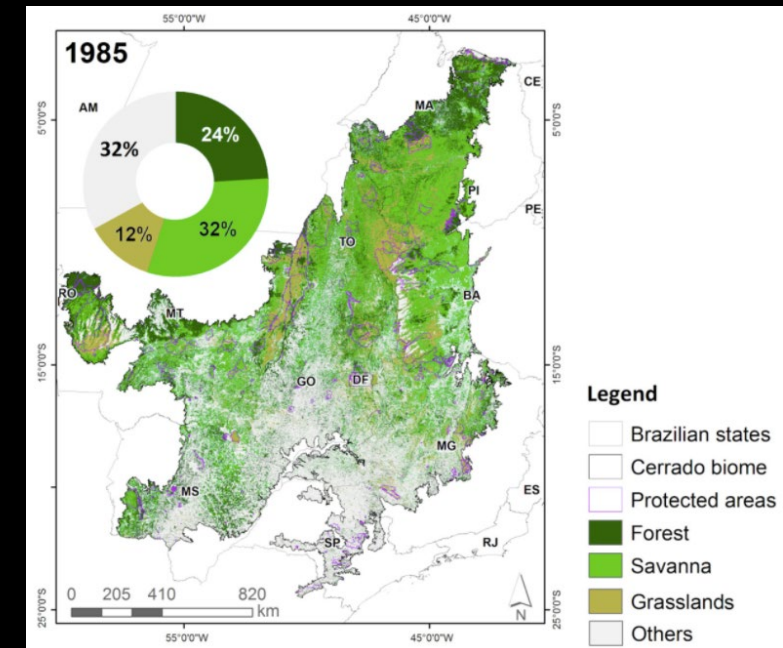

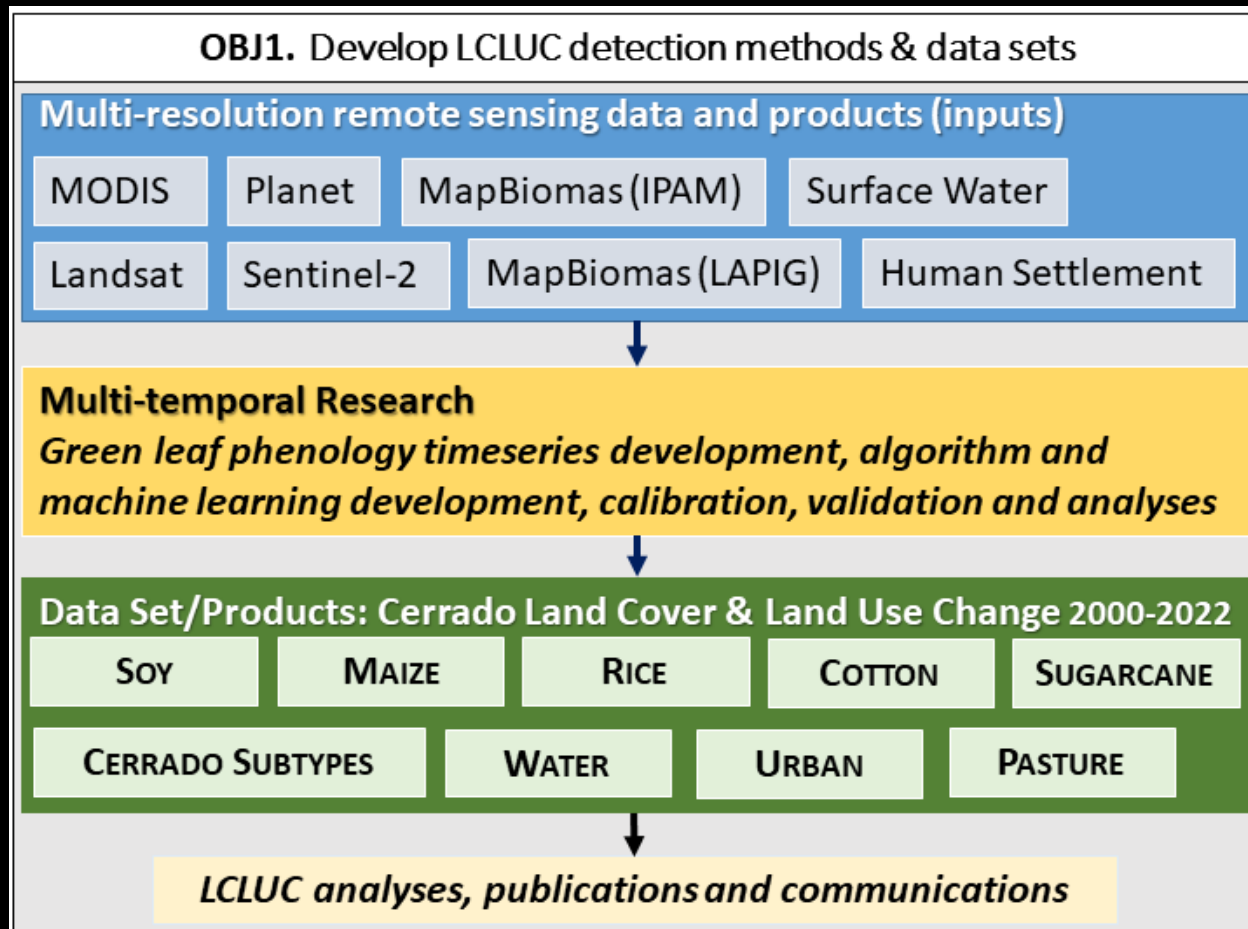

Cerrado LCLUC today

1. Develop LCLUC detection methods and data sets

- Remote sensing analysis for specific crop types and rotations, irrigated agriculture, and pastoral and agricultural abandonment within MapBiomias “cropland” category. New: full Cerrado extent, 2000-2023

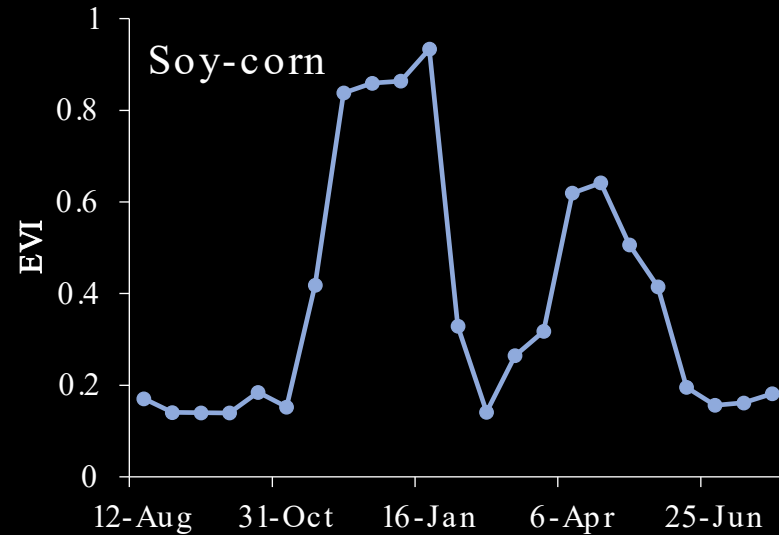

Cerrado land use circa 1985, provided by IPAM and MapBiomias. “Others” refers primarily to pasture lands (Alencar et al. 2020).

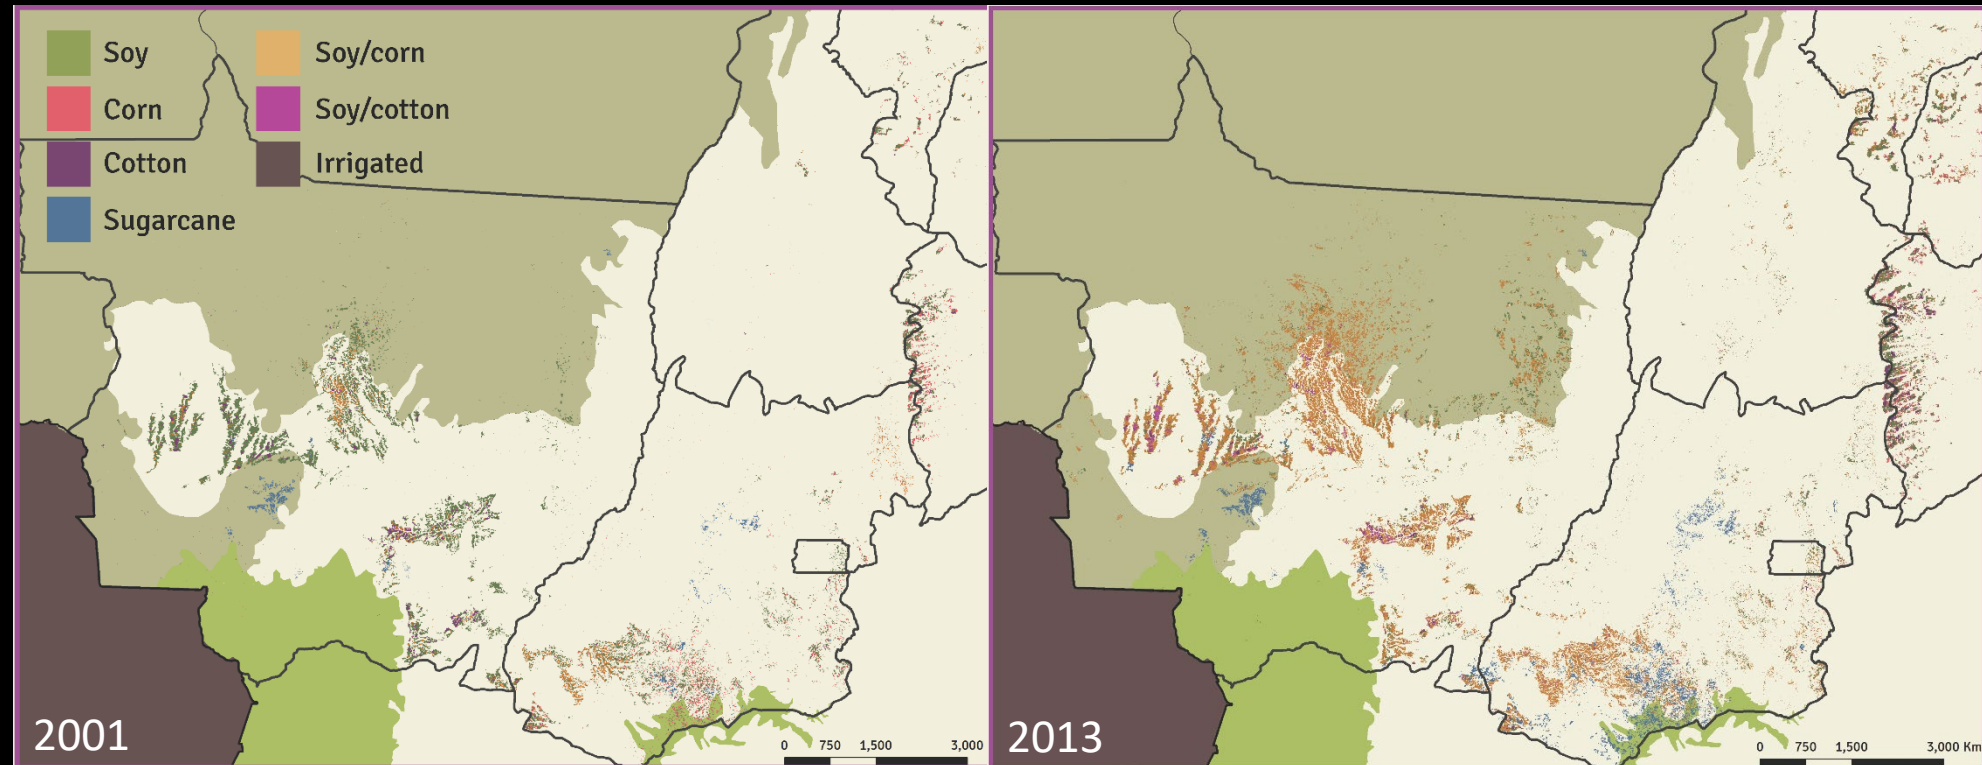

Remotely-sensed (EVI) phenology is very distinct for different land uses

16-day, 250 m resolution
MODIS Enhanced
Vegetation Index (EVI) data

Example map outputs

Total land in agriculture 8,000,000 → 15,200,000 ha

6-fold increase in soy/corn double cropping

(833,000 ha → 5,200,000 ha)

Remote sensing progress

Moving workflow to cloud-based computing and Python

Testing different machine learning algorithms

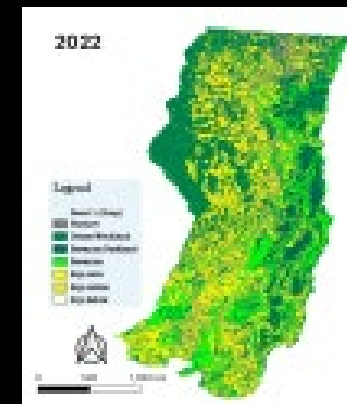

Preliminary results look strong

Updating ground-truth (cal/val) data for crop types or rotations

Work by Uyoyo Adeyemo,
PhD Student/UVM

1. Develop LCLUC detection methods and data sets

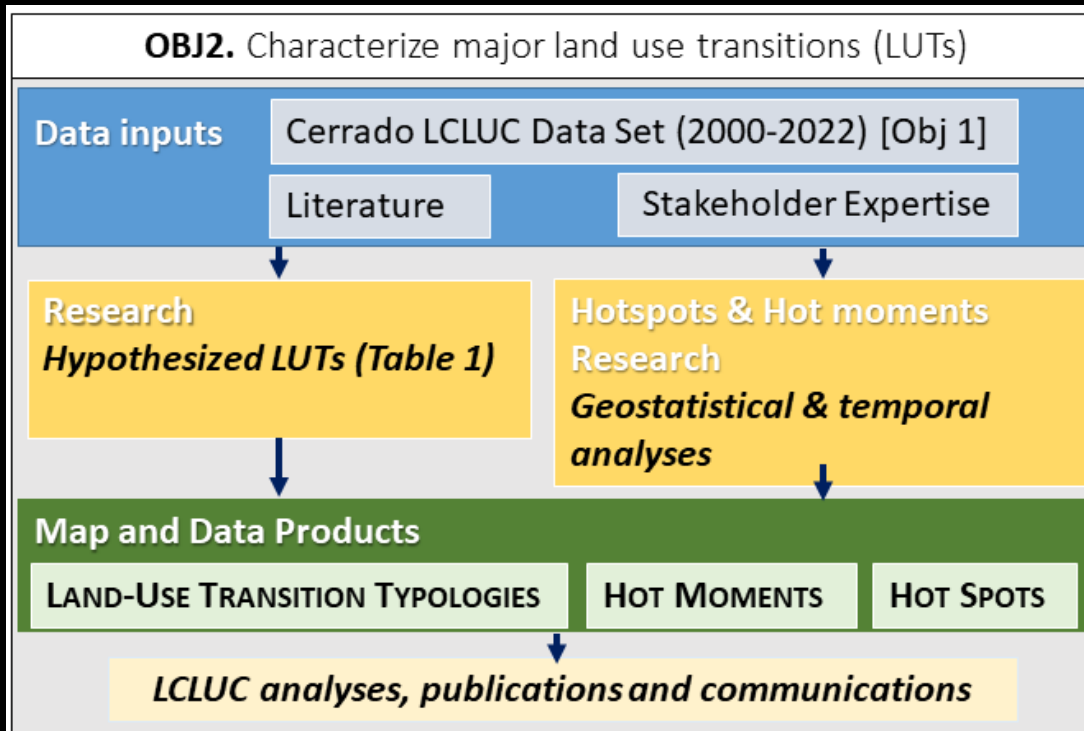

- How has Cerrado land use evolved? (2000-2023)
- Focus: crop types, including rotations, irrigated agriculture, and abandonment
- **Opportunity:** Integration of results into existing platforms as new additional resources (MapBiomas, LAFIG)
- **Opportunity:** cover crop mapping with IPAM

2. Characterize major land use transitions (LUTs)

- Where and when do hot spots and hot moments occur?
- Methods: LUT typologies, classes, geostatistical methods

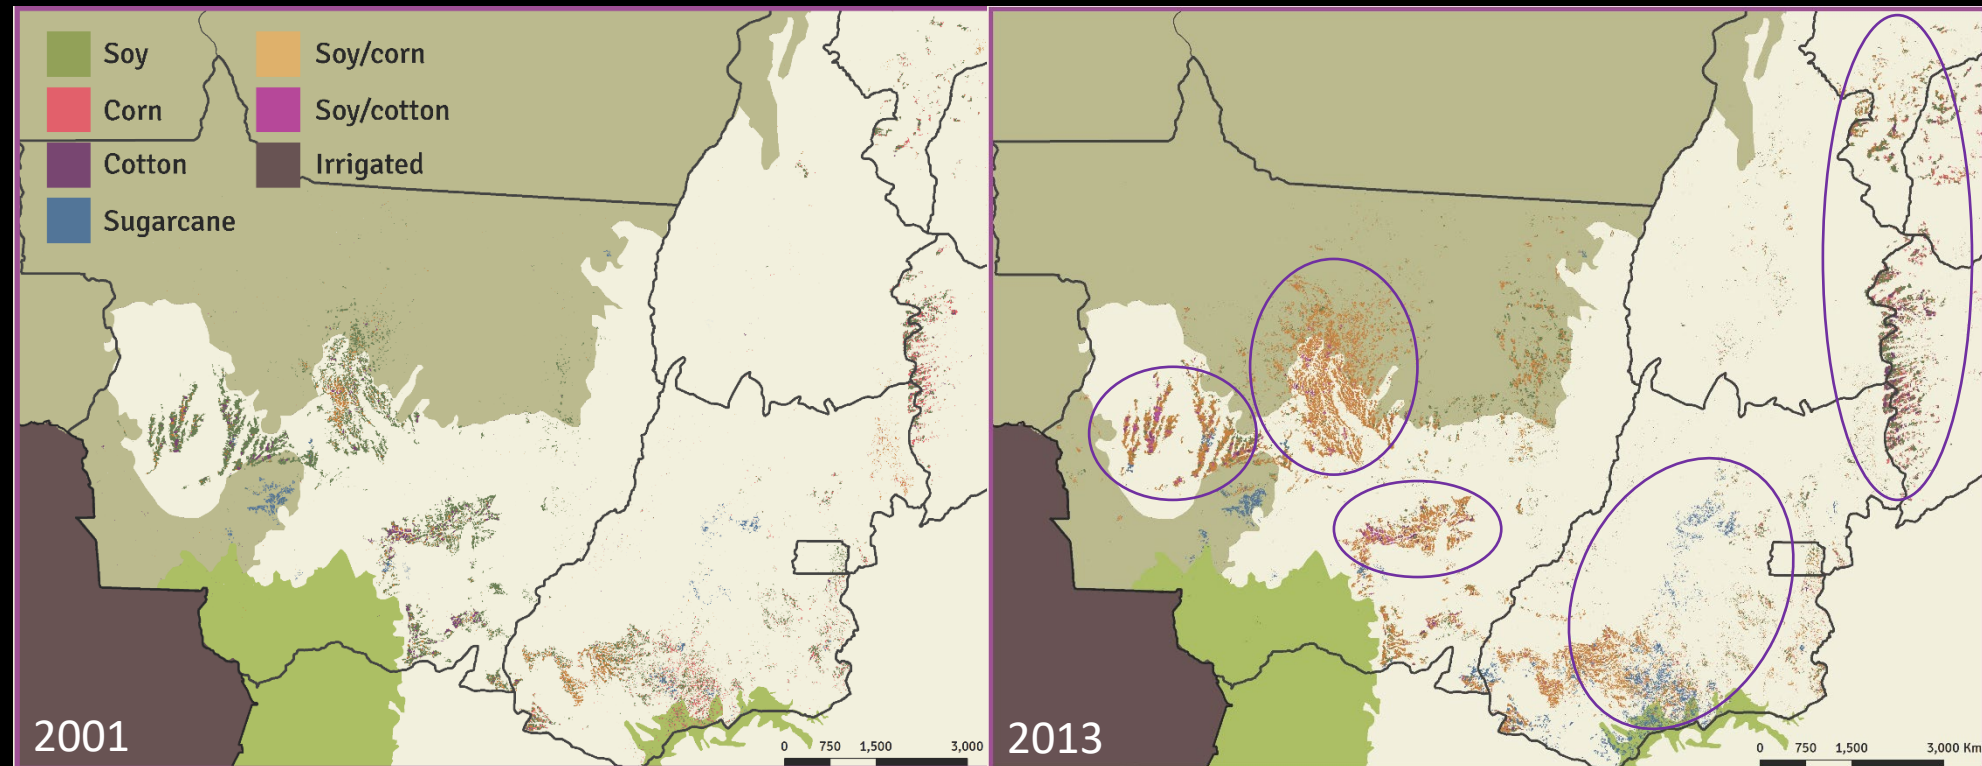

Dr. Ariane Rodrigues,
Postdoc (June 2024)

Hypothesized LUTs	Example
Deforestation	Cerrado → Pasture or Crops
Regrowth	Pasture or Crops → Cerrado
Ag. Expansion	Fallow → Pasture or Crops Pasture → Crops
Ag. Intensification	Pasture → Crops Single Cropping → Double Cropping Single or Double Cropping → Irrigated Ag.

Example hotspots

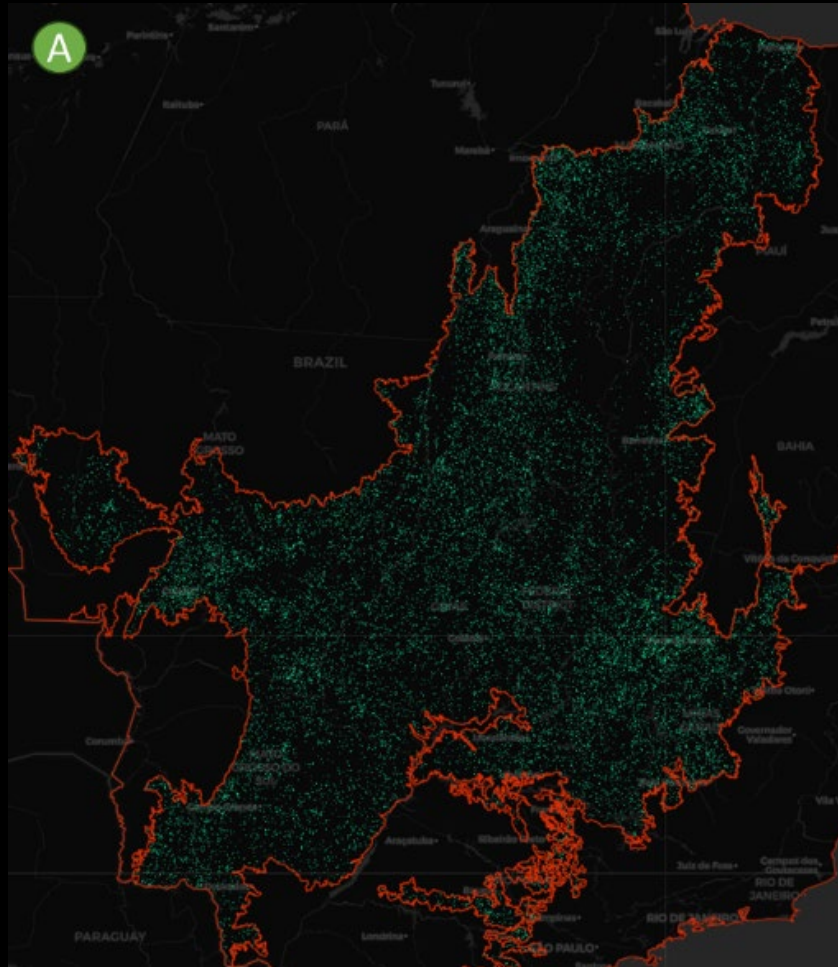

Goal: apply geostatistical approaches to identify hot spots and hot moments and their distinguishing characteristics (environmental & socioeconomic)

Regrowth (restoration?) a noteworthy LUT

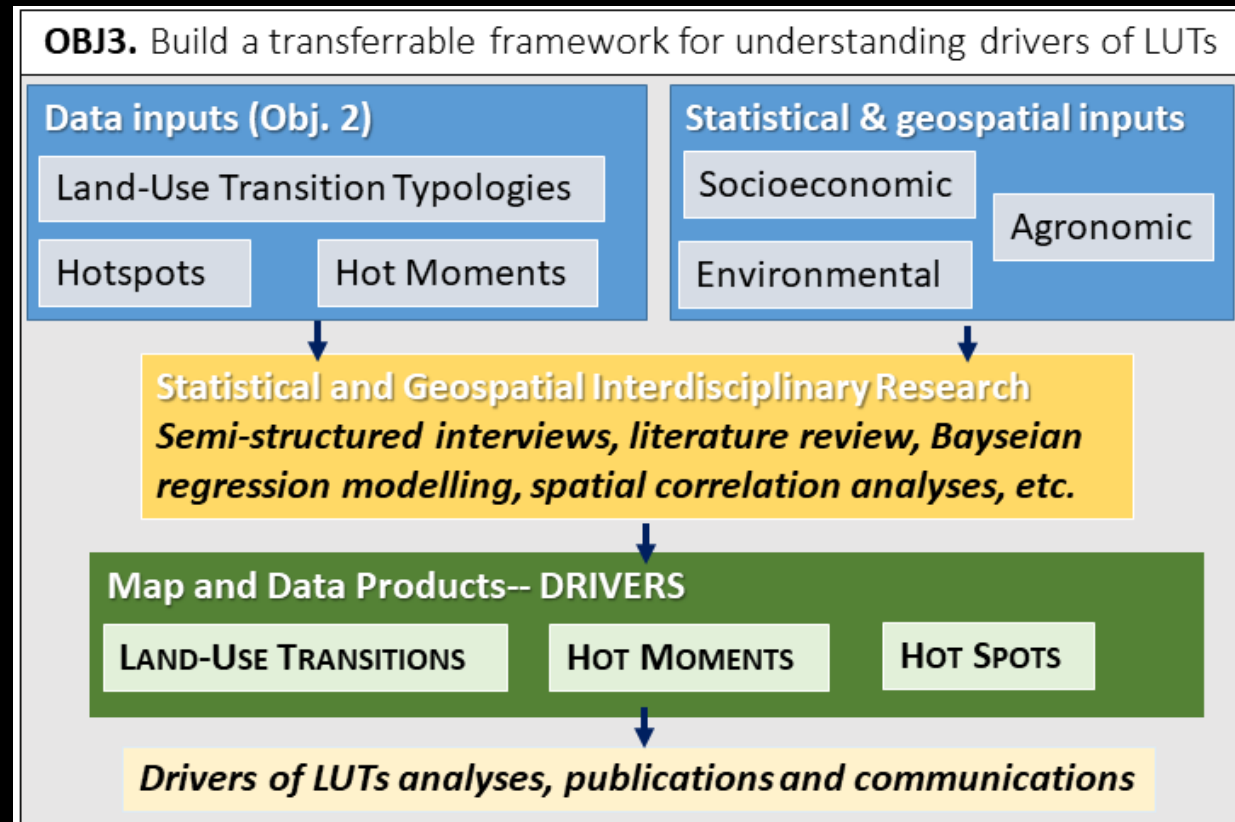

Lara Monteiro,
PhD Student

- Diffuse, but large cumulative impact
- Great interest from regional partners

3. Understanding drivers of LUTs

- What factors influence a LUTs?
- Approach: LUT classes; socioeconomic data/surveys

Targeting incentives to scale up restoration in the Brazilian Cerrado

Literature review of the incentives to promote the restoration of grasslands and savanna ecosystems worldwide

Understanding the socioeconomic reality of restorers at the Cerrado – WHO

Understanding the drivers & motivations behind restoration – WHY

Matching incentives to different profiles of restorers to scale up restoration – HOW
