## Cerrado Biome:

Tropical savanna environment

2<sup>nd</sup> largest biome in Brazil (2 million km<sup>2</sup>)

Highest biodiversity of all tropical savannas

Undergoing rapid conversion

Terra 2004-273 E Terra 2004-273 EVI Terrestrial Biophysics an Remote Sensing Laboratory The University of Arizona http://tbrs.arizona.edu/ 12 ~40 years... Amazônia Caatinga Cerrado Pantanal Mata Atlantica 2010 Pampas the E and 3.0

Cerrado biome: The largest producer of soy, beef, and cotton in Brazil

- ~ 60 million ha of cultivated pasture
- ~ 80 million head of cattle (1.1 head/ha)

National contribution: Beef: 55% Soybean: 63% Cotton: 89% Coffee: 50% Corn: 44% Rice: 37%

## Soybean led the agricultural boom

Largest increases in soy production came from areas of Cerrado

## Sugar/ethanol: expanding rapidly

- Brazil: sugar cane production increased 35% in 5 yrs
- Largely due to increased production in Cerrado

Centro-Oeste: Sugarcane area (ha)

Source: SIDRA/IBGE Galford et al.

### Goals of this project:

Quantify land use and land cover changes in the last decade and relate to biophysical and human drivers

Simulate scenarios of future land cover and land use change as function of regional drivers

Assess impacts of historical and future changes on  $H_2O$ , C,  $N_2O$ ,  $CH_4$ , and climate

## Quantifying Land Cover and Use Change

### Brazilian National Cerrado Deforestation Map

#### Ferreira team at UFG

## Municipal-level deforestation in last decade

Rocha, G.F. et al. Revista Brasileira de Cartografia

Current deforestation is concentrated in two arcs in west and NE

## Total area deforested 47,800 km<sup>2</sup>

MOD13Q1

## Annual deforestation within Cerrado region

Genival et al. (2011)

## Differing deforestation dynamics?

Increased agricultural production in both regions

Decreased clearing in the Amazon but increased clearing in the Cerrado

In Amazon new laws, protected areas, and enforcement appear to reduce deforestation in both biomes

Source: IBGE, LAPIG/UFG Galford et al.

## Agricultural intensification

Sugarcane expansion in Cerrado: (2003 - 2010)

INPE-Canasat, Rudorff et al.

## Sugarcane is expanding predominantly over existing commodities

Manuel Ferreira et al., LAPIG, nov. 2011

## Simulated climate and crop yield as function of deforestation and GHG scenarios

Oliveira et al., in review

# Climate changes from remote (GHG) and local (deforestation)

Deforestation reduces rainfall to point where soy is no longer viable in portions of region

Oliveira et al., in review

Deforestation, intensification, and fires continue at high rates in the Cerrado

Fluxes of C, N, and  $H_20$  have been significantly altered

Large opportunity for agricultural growth without new deforestation

Simulations suggest significant potential for continued deforestation

Future land cover changes are large enough to alter climate and crop yield
