

# Evaluation of High Resolution Data for LCLUC Science

**PI Name: Petya Campbell**

**Affiliation: University of Maryland at Baltimore County, Catonsville, MD**

**Co-Is Name: Fred Huemmrich<sup>1, 2</sup>, Chris Neigh<sup>2</sup> and Elizabeth Middleton<sup>2</sup>**

**Affiliation:** <sup>1</sup> University of Maryland at Baltimore County, Catonsville, MD  
<sup>2</sup> NASA Goddard Space Flight Center

**Project Title: Prototyping Multi-Source Land Imaging (MuSLI) Canopy Chlorophyll (MuSLI Chl) for the Assessment of Vegetation Function and Productivity**

# Objectives (O)

**Goal:** *evaluate the ability of commercial very high resolution (VHR) imagery to develop approaches for remote sensing of canopy chlorophyll content (Chl), and evaluate the uncertainties, as they vary among different vegetation types and structures and in response to seasonal and environmental changes.*

- O1: evaluate the radiometric stability of the VHR commercial imagery containing red edge bands (WV-3, -4 and RapidEye), as compared to ground measurements of stable targets
- Q2: test the VHR data ability to provide consistent VIs to develop stable, transferable algorithms and derive TOC Chl estimates
  - *The accuracy of the estimates will be compared to satellite (L-8 and S-2) and field TOC Chl estimates across the phenology for crops and forests.*
  - *We will assess the ability of the Planet SkySat constellations to provide accurate characterization of canopy topography and structural BRDF parameters.*
- Expected data usefulness and benefits:

# Objectives (O)

## Expected data usefulness and benefits:

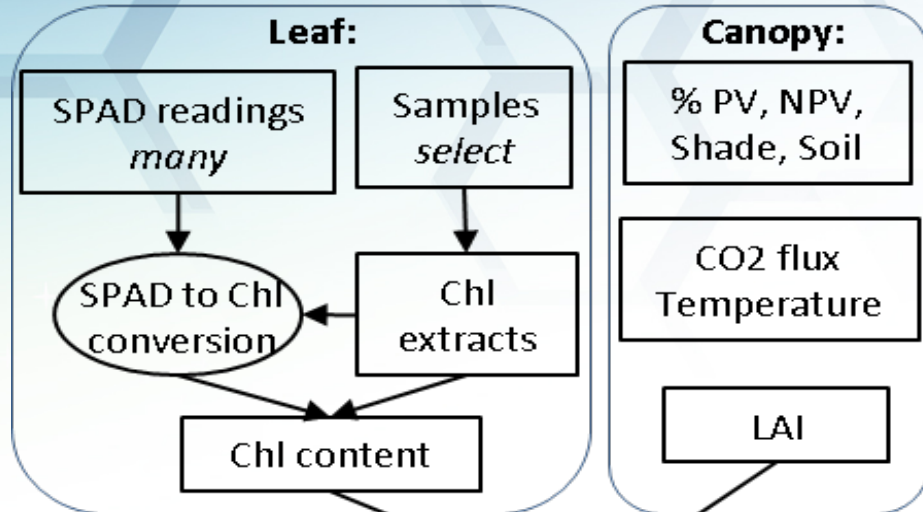

*The research will evaluate the potential to generate VHR multi-temporal maps of TOC Chl at a resolution that exceeds Global Climate Observing System (GCOS) Land ECV by a factor of 10x when using VHR.*

Successful mapping of chlorophyll content at higher spatial resolutions (1-10 m) has applications to support precision agriculture as well as being able to delineate characteristics of smaller fields found in developing countries. Further, spatial variability in chlorophyll can identify the change in productivity of natural ecosystems at the scale of tree crowns, useful information for describing forest phenology and biodiversity.

The commercial satellite data have the potential to directly address Decadal Survey 2017 and NASA Ecosystem science and application questions by quantifying the distribution of functional traits such as TOC Chl and canopy BRDF spatially and over time, and potentially contributing for generating high temporal resolution maps, by combining observations from multiple satellites.

# Technical Approach - Comparisons

## Field data

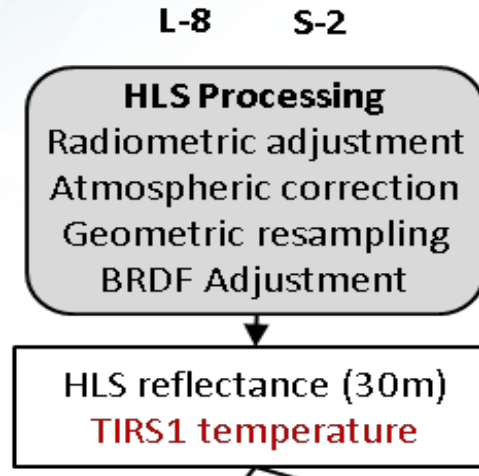

Measured Canopy Chl  
*Leaf Chl x LAI*

Error assessment

Chl x VI  
Algorithms

Chl Maps for Crops and Forests  
Chl Dense Phenology Time Series

## Satellite data

Normalize canopy structure  
validate

VIs 30 m

VIs 2 m

## Research FOCUS

VHR: DG WV-3, PL RE

VHR Processing (team)

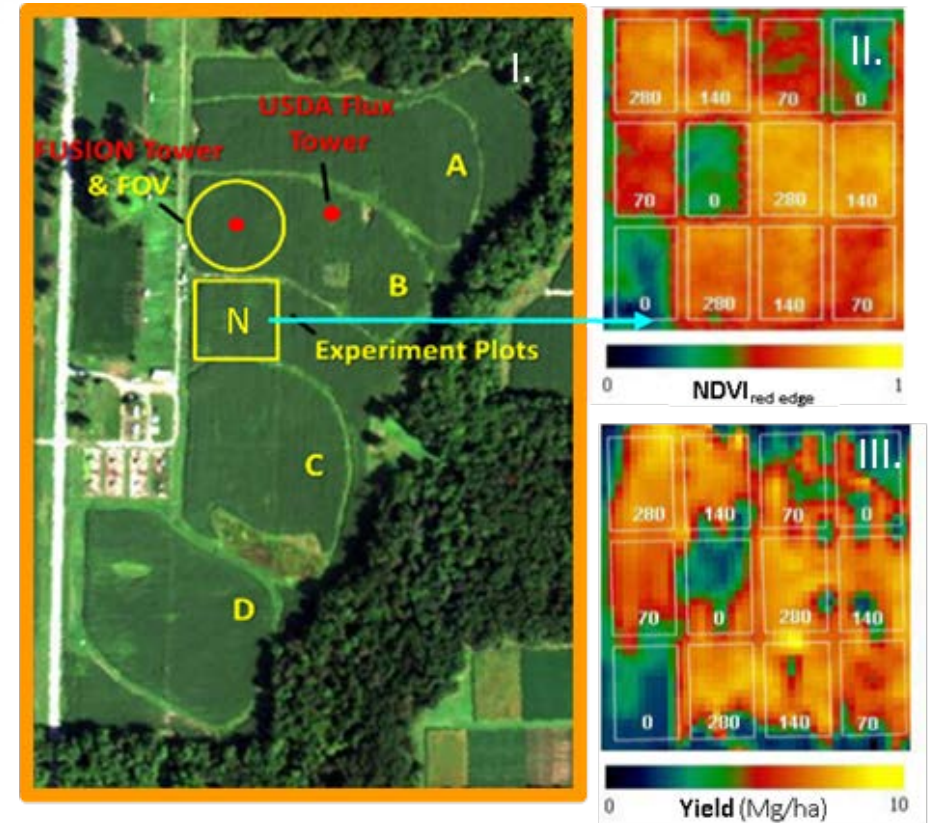

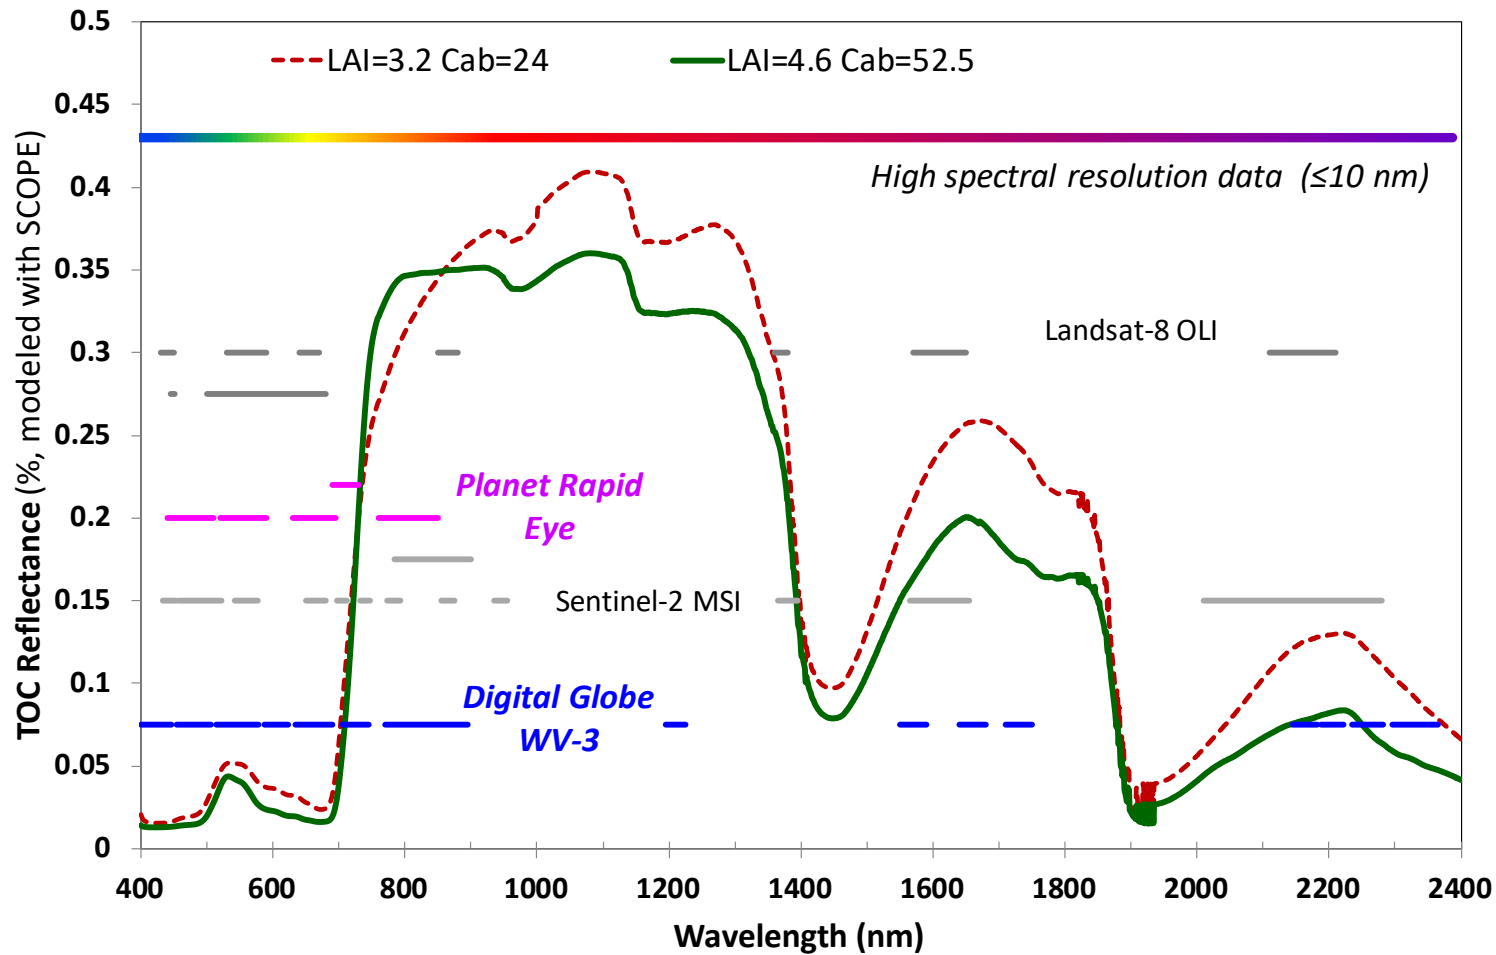

Radiometric adjustment  
Atmospheric correction  
Ortho-rectification and  
Geometric resampling

VHR reflectance  
Scenes & DEMs

Canopy  
Fractions  
CFs 2 m

VIs 2 m

# Technical Approach – Calibration and Validation

**Figure 1.** The OPE3 watershed (I. A, B, C and D) and the N plots (Corp et al. 2010). The NDVI<sub>red edge</sub> index was calculated using  $\sim 1$ m airborne imaging spectrometer (AISA) data (II.). NDVI<sub>red edge</sub> is indicative of canopy chlorophyll, distinguished the N treatments, and was indicative of crop productivity and grain yield (III.).

# Data Requested and Status

## • *Study Sites and Region*

	Study areas	Vegetation cover type(s)	Location (ID, center lat/lon)	Ground data collections
1	OPE3 <sup>1,2</sup> USDA, MD, USA <ul style="list-style-type: none"> <li>• Watershed – present award</li> <li>• N Experiment plots – <i>NEW</i></li> </ul>	Maize (N treatments)	OPE3 (39.030686, -76.84546)	weekly
2	SERC <sup>3</sup> , MD, USA	Mixed hardwood forest	SERC (38.889359, -76.556269)	monthly
3	Mead, NE, USA: Ne1/Ne2 <sup>1</sup> irrigated/not	Maize-Soybean rotation	Ne2 (41.1649, -96.4701)	bi-weekly
4	Czech Republic (agriculture, tundra, forest <sup>1,5</sup> )	Agricultural crops Alpine tundra Norway spruce forest (BK1) Beech forest, ForestGEO	CZ_K_S (50.194215, 15.145881) CZ_Tun (50.723796, 15.694413) CZ_BK1 (49.502115, 18.539068) Cz4GEO (34.978994, 32.731402)	seasonal
5	Paphos forest <sup>4</sup> , Cyprus	Deciduous forest	PF (34.978994, 32.731402)	seasonal

# Data Requested and Status

- **Data download status and plans:**
  - Data type: DigitalGlobe WV-2,-3 and -4, SkySat and RapidEye – specifics on next chart
  - Amount of data:
    - May-October, 2015-2019 including
    - Downloaded 2017 for primary sites
    - Going over 2015 and 2018 images to select
- **Issues or challenges in downloading the data:**
  - Cloud cover obscuring the sites
  - Issue extracting the files – cannot open the \*.zip files (36.4 %)

# Data Requested (Specifics)

- *VHR Data Requests – existing and new acquisitions (2019)*

Provider	Platform	Dataset	Frequency	Evaluation / Products
Digital Globe	WorldView-2 WorldView-3 WorldView-4	L1B (4 and 8 band bundles, red-edge key; VNIR, WV-3 SWIR, and CAVIS)	weekly	<ol style="list-style-type: none"> <li>1. Radiometric stability and geolocation accuracy</li> <li>2. VIs (TOC Chl and dry matter, ECVs included NDVI &amp; NDWI)</li> <li>3. Stereo-pairs: TOC topography, canopy density, sun/shade, DEMs</li> <li>4. LCC due to water and nitrogen availability, and phenology</li> </ol>
Planet Labs	<u>RapidEye</u> constellation	<u>RapidEye</u> (6.5 m)	weekly	<ol style="list-style-type: none"> <li>1. Radiometric stability and geolocation accuracy;</li> <li>2. Red-edge VIs for estimation of TOC Chl</li> </ol>
	<u>SkySat</u> constellation	<u>SkySat</u> -(4-13) stereo-pairs	bi-weekly	<ol style="list-style-type: none"> <li>1. Point-clouds, canopy surface topography, sun/shade green/brown fractions</li> </ol>
