

# Web-enabled Landsat data (WELD) Project

a 5 year NASA Making Earth System data records for Use in Research Environments (MEASURES) funded project

**David Roy & Junchang Ju & Indrani Kommareddy**

Geographic Information Science Center of Excellence  
South Dakota State University, USA

Spring LCLUC ST Meeting, Bethesda, MD April 20-22<sup>nd</sup> 2010

# What the Landsat user community wants ...

- Derived Landsat data products for free
- **Systematic, consistent, community endorsed data processing**
  - calibration, geolocation
  - radiometric normalization / BRDF correction, atmospheric correction
  - cloud-screened, snow-screened, SLC-off gap filling  
(needed in order to derive higher level bio/geophysical & LC products)
- **Composited large-area data product mosaics**
  - updated at the pixel level
  - using all the Landsat data, not just select acquisitions
  - processed shortly after acquisition i.e. “near real time”
- *Similar to the NASA MODIS land products but at high spatial resolution*
- *Above is what the WELD project is developing, building on our 10 year MODIS product development, processing (and reprocessing) experience.*

# WELD products

- 30m ETM+ composited mosaics
  - Weekly
  - Monthly
  - Seasonal
  - Annual
- Alaska
- Conterminous United States
- 7 years
- Generated from every L1T ETM+ acquisition in the USGS EROS archive with cloud cover  $\leq 80\%$
- Generated by applying MODIS Land heritage processing techniques

# WELD ETM+ Data Processing Steps

- TOA reflectance & brightness temperature
- View and solar geometry computation
- Cloud masking
- SLC-Off and cloud gap filling
- Reprojection: UTM to Albers map projection
- Compositing: weekly, monthly, seasonal, annual
- Atmospheric correction
- Radiometric/BRDF normalization
- Land cover characterization
- Browse generation

# WELD ETM+ Data Processing Steps

## Steps that use contemporaneous MODIS Products

- TOA reflectance & brightness temperature
- View and solar geometry computation
- Cloud masking
- SLC-Off and cloud gap filling
- Reprojection: UTM to Albers map projection
- Compositing: monthly, seasonal, annual
- Atmospheric correction (Eric Vermote)
- Radiometric/BRDF normalization
- Land cover characterization (Matt Hansen)
- Browse generation

## Web-enabled Landsat data (WELD) Project

The WELD project is systematically generating 30 m composited Landsat ETM+ mosaics at weekly, monthly, seasonal and annual time periods for the conterminous USA (CONUS) and Alaska. The composited mosaics are designed to provide consistent Landsat data that can be used to derive land cover and geo physical and bio physical products for regional assessment of surface dynamics and to study Earth system functioning.

Version 1.3 of the WELD monthly, seasonal and annual products generated from Landsat ETM+ terrain corrected (Level 1T) data with cloud cover  $\leq 80\%$  sensed December 2007 to November 2008 are available here.

### WELD Browse Imagery

The thumbnail images below illustrate the currently available Version 1.3 WELD data products, please click on them to see a higher resolution version. These true color browse images show the Landsat ETM+ red, green and blue wavelength bands at approximately 500 m resolution.

# Landsat ETM+ and MODIS Terra in same orbit

**North West:** Top of atmosphere Landsat ETM+ true color (red , green and blue bands); **South East:** Corresponding Surface reflectance computed using contemporaneous MODIS atmosphere parameterization data.

(Landsat Path 17 Row 34, Giles, Virginia, acquired July 18, 2008).

The atmospheric correction reduces visible reflectance, greatest reductions in the shorter wavelength blue band which has more atmospheric scattering, and with the green atmospherically corrected band showing greater reflectance after correction which is expected given that the scene is dominated by veg.

$$y = 1.37x - 0.11, r^2 = 0.9194$$

# Advanced MODIS V LEDAPS Band 7 SR (blue, 2.09-2.35 $\mu$ m), 373,013 pixels, 10 scenes

**Next:** we are working with Eric Vermote on validation of the 2 methods with AERONET

-> goal of selecting the most reliable atm. correction method

# Radiometric Normalization

- WELD processing (conversion to reflectance, cloud screening, atmospheric correction, compositing) will largely remove reflectance variations
- Except for reflectance differences due to illumination & observation angles

$$\hat{\rho}_{ETM+,t1}(\Omega_{ETM+}, \Omega_{nadir}, \Omega'_{solar\ noon}) = c \times \rho_{ETM+,t1}(\Omega_{observed}, \Omega'_{observed})$$

$$c = \frac{\hat{\rho}_{MODIS,t1}(\Omega_{MODIS}, \Omega_{nadir}, \Omega'_{solar\ noon})}{\hat{\rho}_{MODIS,t1}(\Omega_{MODIS}, \Omega_{observed}, \Omega'_{observed})}$$

$\hat{\rho}_{MODIS}$  computed from MODIS 16-day 500m BRDF/Albedo product spectral BRDF model parameters

Thus, Landsat reflectance may be normalized to some desired geometry e.g., nadir view zenith and local solar noon, for each 500m MODIS pixel.
